

Inventory · v4.2

# Inventory that reconciles itself.

Every movement is an event. Counts are derived, never edited — so the number on the screen is the number on the shelf, and you can prove how it got there.

|--------------------------------|---------------------------|----------------------------|-----------------|
| 99.98%                         | 4.1M                      | <40ms                      | 21              |
| Count accuracy after 12 months | Movements processed daily | Median availability lookup | Warehouses live |

## Built on an append-only ledger

No stored quantity to drift out of sync. Ask what the stock was at any instant and the answer is a replay, not a guess.

Event-sourced counts

Reservations that hold

Cycle counts, not shutdowns

Receipts, picks, adjustments and counts are facts. The quantity is a fold over them, recomputed on demand and cached, never written by hand.

Availability subtracts open reservations at read time, so two orders can never take the last unit — even across regions.

Count a shelf while the warehouse keeps running. Discrepancies land as their own events with an author and a reason.

# From dock to dispatch

Four steps, each one an event on the same ledger.

01

**Receive**

Scan the pallet. Quantities land against a purchase order and a location.

02

**Reserve**

An order claims units the moment it is placed, before anything is picked.

03

**Pick**

The reservation converts to a movement, routed by shortest travel path.

04

**Dispatch**

Stock leaves the ledger and the carrier handoff is recorded with it.

# Every integration speaks events

Subscribe to the stream, or let us push. Both are the same ledger.

| CHANNEL      | TRANSPORT | DELIVERY                       | TYPICAL USE             |
|--------------|-----------|--------------------------------|-------------------------|
| Stream       | grpc      | At least once, ordered per SKU | Storefront availability |
| Webhooks     | https     | At least once, retried 24h     | ERP synchronisation     |
| Batch export | parquet   | Hourly snapshot                | Analytics warehouse     |
| Query API    | rest      | Synchronous                    | Point-in-time audit     |

# Pricing

Per warehouse, per month. Movements are never metered.

## SINGLE SITE

**€180** /month

- One warehouse
- Unlimited movements
- Query API and webhooks
- 90-day ledger history

[Start free](#)

## NETWORK

**€140** /site/month

- Up to 25 warehouses
- Cross-site reservations
- Event stream and batch export
- Unlimited ledger history
- Priority support

[Start free](#)

## ENTERPRISE

**Talk to us**

- Unlimited warehouses
- Single tenant deployment
- Custom retention and residency
- 99.99% availability SLA
