

Floor app

Count the shelf without stopping the warehouse.

Cycle counts run alongside picking. Every discrepancy is recorded as its own event, with an author, a reason and a timestamp you can replay later.

Designed for one hand and a scanner

The floor app is the same ledger as the API — there is no separate stock number to fall out of sync.

Blind counts by default

The expected quantity is hidden until the count is submitted, so nobody is nudged towards the number the system already believes.

Works with no signal

Counts queue locally and reconcile in order when the device comes back. Cold stores and basements were the design constraint.

Discrepancies need a reason

Damage, miscount, theft or mislocation. The reason travels with the event and lands in the monthly shrinkage report on its own.

"We used to shut a bay for a morning to count it. Now it happens between picks and nobody notices."

Operations lead, three-site distributor

What a count costs you

Measured across 21 sites over the last quarter.

MEASURE	BEFORE	WITH MERIDIAN
Bay downtime per count	3.5 h	0 h
Full-site count frequency	Quarterly	Continuous
Unexplained shrinkage	1.8%	0.3%
Time to trace a discrepancy	2 days	Instant

Questions we get asked

Does it replace our WMS?

No. It owns the count and the ledger; your WMS keeps routing and labour. The event stream is the seam between them

stream is the sum between them.

What happens to historic adjustments?

They import as events dated when they happened, so opening balances replay correctly rather than appearing as a lump on day one.

Which scanners are supported?

Anything that emits keyboard input, plus native integrations for the three common Android rugged handhelds.

Try it on one aisle.

Import a snapshot, count a single bay, and compare the trail against your WMS.
