Lists

Text and inline formatting

Standard Markdown works as expected: **bold**, *italic*, `inline code`, ~~strikethrough~~, and links. Typographic replacement turns “quotes” into curly ones and – into en dashes.

Blockquotes, like every other element, are styled against the `.doc` wrapper in `theme.css` rather than through `@tailwindcss/typography`'s `prose` class.

Tailwind classes in Markdown

Because Tailwind scans the generated HTML, utility classes work three ways.

Via markdown-it-attrs

That heading carries `{.text-blue-600}` in the source.

Via inline HTML

Note the `break-inside-avoid` class — Tailwind's page-break utilities work here, so this card row is kept whole rather than split across pages.

CHANGE

Via the document wrapper

Classes on the `.doc` wrapper in `wrapDocument()` apply to the whole document; edit `theme.css` to change the house style for every document at once.

Syntax highlighting

Handled by `highlight.js` at build time, so there is no browser work and the output is deterministic.

```
export async function renderPdf(html: string,
out: string): Promise<void> {
    const browser = await puppeteer.launch({ args:
['--no-sandbox'] });
    const page = await browser.newPage();
    await page.setContent(html, { waitUntil:
'networkidle0' });
    await page.pdf({ path: out, format: 'A4',
printBackground: true });
    await browser.close();
}
```

```
select sku, sum(quantity) as qty
from inventory_movement
where warehouse = 'north'
group by sku
order by qty desc;
```

Mathematical notation

TeX is typeset by **KaTeX** at build time, alongside the syntax highlighter — the HTML that reaches the browser already contains the finished formulas.

Inline math goes between single dollars: the harmonic mean of P and R is $F = \frac{2PR}{P+R}$, and a point $x \in \mathbb{R}^n$ has $\|x\|_2 = \sqrt{\sum_i x_i^2}$.

Display math goes between double dollars, on their own lines:

$$d^2(x,u) = (x_1 - u_1)^2 + (x_2 - u_2)^2 + \cdots + (x_n - u_n)^2$$

A fenced block tagged `math` is the same thing, for editors that prefer a fence:

$$P(c \mid x) \propto P(c) \prod_{j=1}^m P(x_j \mid c)$$

Environments, alignment and boxed results all work:

acc = $\frac{TP + TN}{TP + FP + FN + TN}$

$P = \frac{TP}{TP + FP}$ $R = \frac{TP}{TP + FN}$

$F = \frac{2PR}{P + R} = \boxed{\frac{25}{33}} \approx 0.76$

$A = \begin{bmatrix} 3 & 2 & 1 \\ -1 & 1 & 0 \\ 0 & 1 & -1 \end{bmatrix}$ $\Theta(n \log n) \leq \Theta(n^2)$

To write a literal dollar sign, escape it: \$4.99 stays text.

Mermaid diagrams

Each fence is rendered in-page and **awaited** before the PDF is snapshotted — the step that `md-to-pdf` gets wrong.

Tables

Warehouse	Region	Location prefix	Units
north-1	North	N1	4,102
south-1	South	S1	6,238
south-2	South	S2	3,598

Lists

1. Ordered lists survive page breaks.
2. Nested items indent correctly.

• Unordered child

• Another child
3. Task lists render as plain checkboxes:

☒ Mermaid rendering awaited

☒ Math typeset at build time

☒ Tailwind compiled per-document

☐ Cached CSS between runs
